$$\Pr(X + Y = 2 \mid X - Y = 0)$$

$$= \frac{\Pr((X + Y = 2), (X - Y = 0))}{\Pr(X - Y = 0)}$$

$$= \frac{\frac{1}{16}}{\frac{6}{16}} = \frac{1}{6} \quad (0.0.3)$$

Thus option c) is correct

PROBLEM GATE-28

Consider two independent random variables X and Y with identical distributions. The variables X and Y take value 0,1 and 2 with probabilities $\frac{1}{2}$, $\frac{1}{4}$ and $\frac{1}{4}$ respectively. What is the conditional probability $\Pr(X + Y = 2 \mid X - Y = 0)$?

- 1) 0
- 2) $\frac{1}{16}$
- 3) $\frac{1}{6}$
- 4) 1

SOLUTION

The values that the random variable X can take along with its probabilities are given by

X	0	1	2
Pr(X)	$\frac{1}{2}$	$\frac{1}{4}$	$\frac{1}{4}$

The values that the random variable Y can take along with its probabilities are given by

Y	0	1	2
Pr(Y)	$\frac{1}{2}$	$\frac{1}{4}$	$\frac{1}{4}$

$$\Pr(X - Y = 0) = \frac{1}{2} \times \frac{1}{2} + \frac{1}{4} \times \frac{1}{4} + \frac{1}{4} \times \frac{1}{4} = \frac{6}{16} \quad (0.0.1)$$

$$\Pr((X + Y = 2), (X - Y = 0)) = \frac{1}{4} \times \frac{1}{4} = \frac{1}{16} \quad (0.0.2)$$
